LE25FS406 CMOS IC 4M-bit (512K×8) Serial Flash Memory

Overview

The LE25FS406 is a SPI bus flash memory device with a 4M bit (512K × 8-bit) configuration. It uses a single 1.8V power supply. While making the most of the features inherent to a serial flash memory device, the LE25FS406 is housed in an 8-pin ultra-miniature package. All these features make this device ideally suited to storing program in applications such as portable information devices, which are required to have increasingly more compact dimensions. The LE25FS406 also has a small sector erase capability which makes the device ideal for storing parameters or data that have fewer rewrite cycles and conventional EEPROMs cannot handle due to insufficient capacity.

Features

- Read/write operations enabled by single 1.8V power supply: 1.65 to 2.10V supply voltage range
- Operating frequency : 30MHz
- Temperature range : 0 to 70°C / -40 to +85°C (at the planning stage)
- Serial interface : SPI mode 0, mode 3 supported
- Sector size : 4K bytes/small sector, 64K bytes/sector
- Small sector erase, sector erase, chip erase functions
 - Page program function (256 bytes / page)
- Block protect function
 - Data retention period : 20 years
- Status functions : Ready/busy information, protect information
- Highly reliable read/write
 - Number of rewrite times: 100,000 times
 - Small sector erase time : 40ms (typ.), 150ms (max.)
 - Sector erase time : 80ms (typ.), 250ms (max.)
 - Chip erase time : 300ms (typ.), 3.0s (max.)
 - Page program time : 6.0ms/256 bytes (typ.), 8.0ms/256 bytes (max.)
- Package : LE25FS406TT MSOP8 (225mil): planning
 : LE25FS406LF VSON8N(6.0 × 5.0)
 : LE25FS406MA MFP8 (225mil)
 : LE25FS406FQ VSON8(4.0 × 3.0)

* This product is licensed from Silicon Storage Technology, Inc. (USA), and manufactured and sold by SANYO Semiconductor Co., Ltd.

■ Any and all SANYO Semiconductor Co.,Ltd. products described or contained herein are, with regard to "standard application", intended for the use as general electronics equipment (home appliances, AV equipment, communication device, office equipment, industrial equipment etc.). The products mentioned herein shall not be intended for use for any "special application" (medical equipment whose purpose is to sustain life, aerospace instrument, nuclear control device, burning appliances, transportation machine, traffic signal system, safety equipment etc.) that shall require extremely high level of reliability and can directly threaten human lives in case of failure or malfunction of the product or may cause harm to human bodies, nor shall they grant any guarantee thereof. If you should intend to use our products for applications outside the standard applications of our customer who is considering such use and/or outside the scope of our intended standard applications, please consult with us prior to the intended use. If there is no consultation or inquiry before the intended use, our customer shall be solely responsible for the use.

■ Specifications of any and all SANYO Semiconductor Co.,Ltd. products described or contained herein stipulate the performance, characteristics, and functions of the described products in the independent state, and are not guarantees of the performance, characteristics, and functions of the described products as mounted in the customer's products or equipment. To verify symptoms and states that cannot be evaluated in an independent device, the customer should always evaluate and test devices mounted in the customer's products or equipment.

Figure 2 Block Diagram

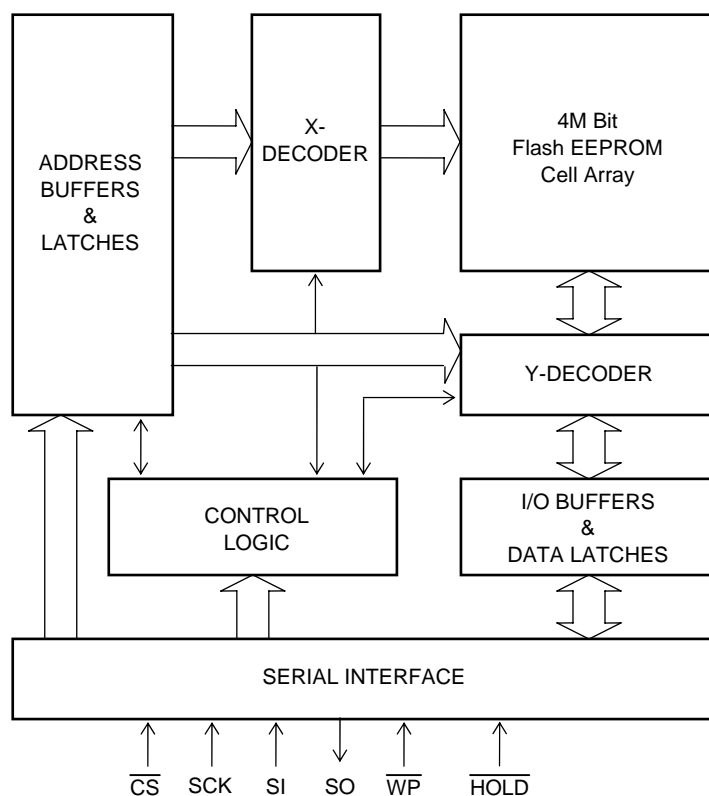

Table 1 Pin Description

Symbol	Pin Name	Description
SCK	Serial clock	This pin controls the data input/output timing. The input data and addresses are latched synchronized to the rising edge of the serial clock, and the data is output synchronized to the falling edge of the serial clock.
SI	Serial data input	The data and addresses are input from this pin, and latched internally synchronized to the rising edge of the serial clock.
SO	Serial data output	The data stored inside the device is output from this pin synchronized to the falling edge of the serial clock.
$\overline{\text{CS}}$	Chip select	The device becomes active when the logic level of this pin is low; it is deselected and placed in standby status when the logic level of the pin is high.
$\overline{\text{WP}}$	Write protect	The status register write protect (SRWP) takes effect when the logic level of this pin is low.
$\overline{\text{HOLD}}$	Hold	Serial communication is suspended when the logic level of this pin is low.
V _{DD}	Power supply	This pin supplies the 1.65 to 2.10V supply voltage.
V _{SS}	Ground	This pin supplies the 0V supply voltage.

Device Operation

The read, erase, program and other required functions of the device are executed through the command registers. The serial I/O corrugate is shown in Figure 3 and the command list is shown in Table 2. At the falling \overline{CS} edge the device is selected, and serial input is enabled for the commands, addresses, etc. These inputs are normalized in 8 bit units and taken into the device interior in synchronization with the rising edge of SCK, which causes the device to execute operation according to the command that is input.

The LE25FS406 supports both serial interface SPI mode 0 and SPI mode 3. At the falling \overline{CS} edge, SPI mode 0 is automatically selected if the logic level of SCK is low, and SPI mode 3 is automatically selected if the logic level of SCK is high.

Read silicon ID 2 *3	ABh	X	X	X			
power down	B9h						
Exit power down mode	ABh						

Explanatory notes for Table 2

"X" signifies "don't care" (that is to say, any value may be input).

The "h" following each code indicates that the number given is in hexadecimal notation.

Addresses A23 to A19 for all commands are "Don't care".

*1: "RD" stands for read data. *2: "PD" stands for page program data.

Description of Commands and Their Operations

A detailed description of the functions and operations corresponding to each command is presented below.

1. Standard SPI read

There are two read commands, the standard SPI read command and High-speed read command.

1-1. Read command

Consisting of the first through fourth bus cycles, the 4 bus cycle read command inputs the 24-bit addresses following (03h). The data is output from SO on the falling clock edge of fourth bus cycle bit 0 as a reference. "Figure 4-a Read" shows the timing waveforms.

Figure 5-a 4 Bus Read

1-2. High-speed Read command

Consisting of the first through fifth bus cycles, the High-speed read command inputs the 24-bit addresses and 8 dummy bits following (0Bh). The data is output from SO using the falling clock edge of fifth bus cycle bit 0 as a reference. "Figure 4-b High-speed Read" shows the timing waveforms.

Figure 4-b High-speed Read

When SCK is input continuously after the read command has been input and the data in the designated addresses has been output, the address is automatically incremented inside the device while SCK is being input, and the corresponding data is output in sequence. If the SCK input is continued after the internal address arrives at the highest address (7FFFh), the internal address returns to the lowest address (0000h), and data output is continued. By setting the logic level of \overline{CS} to high, the device is deselected, and the read cycle ends. While the device is deselected, the output pin SO is in a high-impedance state.

2. Status Registers

The status registers hold the operating and setting statuses inside the device, and this information can be read (status register read) and the protect information can be rewritten (status register write). There are 8 bits in total, and "Table 4 Status registers" gives the significance of each bit.

Table 4 Status Registers

Bit	Name	Logic	Function	Power-on Time Information				
Bit0	$\overline{\text{RDY}}$	0	Ready	0				
		1	Erase/Program					
Bit1	WEN	0	Write disabled	0				
		1	Write enabled					
Bit2	BP0	0	Block protect information Protecting area switch	Nonvolatile information				
		1						
Bit3	BP1	0			Block protect information Protecting area switch	Nonvolatile information		
		1						
Bit4	BP2	0					Block protect information Protecting area switch	Nonvolatile information
		1						
Bit5	TB	0	Block protect Upper side/Lower side switch	Nonvolatile information				
		1						
Bit6			Reserved bits	0				
Bit7	SRWP	0	Status register write enabled	Nonvolatile information				
		1	Status register write disabled					

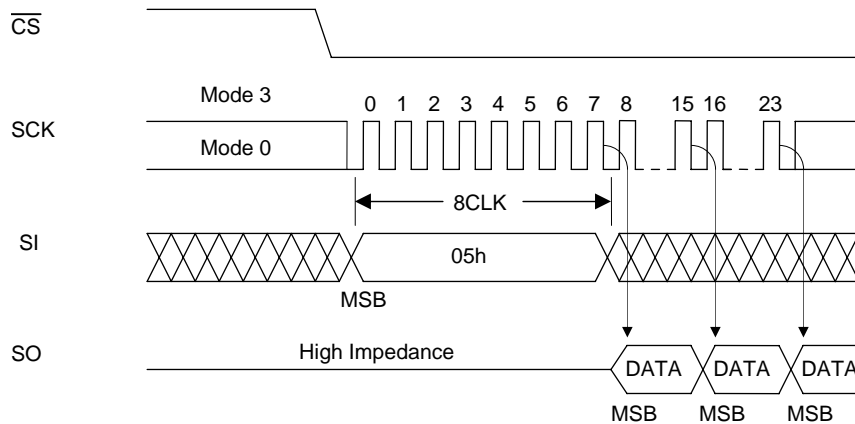

2-1. Status register read

The contents of the status registers can be read using the status register read command. This command can be executed even during the following operations.

- Small sector erase, sector erase, chip erase
- Page program
- Status register write

"Figure 6 Status Register Read" shows the timing waveforms of status register read. Consisting only of the first bus cycle, the status register command outputs the contents of the status registers synchronized to the falling edge of the clock (SCK) with which the eighth bit of (05h) has been input. In terms of the output sequence, SRWP (bit 7) is the first to be output, and each time one clock is input, all the other bits up to RDY (bit 0) are output in sequence, synchronized to the falling clock edge. If the clock input is continued after RDY (bit 0) has been output, the data is output by returning to the bit (SRWP) that was first output, after which the output is repeated for as long as the clock input is continued. The data can be read by the status register read command at any time (even during a program or erase cycle).

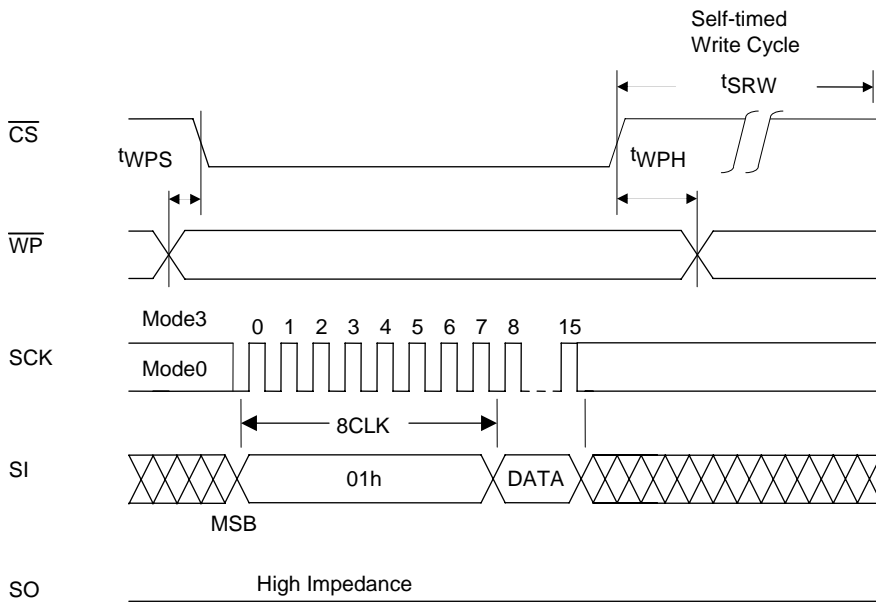

Figure 6 Status Register Read

2-2. Status register write

The information in status registers BP0, BP1, BP2, TB and SRWP can be rewritten using the status register write command. RDY, WEN and bit 6 are read-only bits and cannot be rewritten. The information in bits BP0, BP1, BP2, TB and SRWP is stored in the non-volatile memory, and when it is written in these bits, the contents are retained even at power-down. "Figure 7 Status Register Write" shows the timing waveforms of status register write, and Figure 20 shows a status register write flowchart. Consisting of the first and second bus cycles, the status register write command initiates the internal write operation at the rising CS edge after the data has been input following (01h). Erase and program are performed automatically inside the device by status register write so that erasing or other processing is unnecessary before executing the command. By the operation of this command, the information in bits BP0, BP1, BP2, TB and SRWP can be rewritten. Since bits RDY (bit 0), WEN (bit 1) and bit 6 of the status register cannot be written, no problem will arise if an attempt is made to set them to any value when rewriting the status register. Status register write ends can be detected by RDY of status register read. To initiate status register write, the logic level of the WP pin must be set high and status register WEN must be set to "1".

Figure 7 Status Register Write

2-3. Contents of each status register

RDY (Bit 0)

The RDY register is for detecting the write (program, erase and status register write) end. When it is "1", the device is in a busy state, and when it is "0", it means that write is completed.

WEN (bit 1)

The WEN register is for detecting whether the device can perform write operations. If it is set to "0", the device will not perform the write operation even if the write command is input. If it is set to "1", the device can perform write operations in any area that is not block-protected.

WEN can be controlled using the write enable and write disable commands. By inputting the write enable command (06h), WEN can be set to "1"; by inputting the write disable command (04h), it can be set to "0." In the following states, WEN is automatically set to "0" in order to protect against unintentional writing.

- At power-on
- Upon completion of small sector erase, sector erase or chip erase
- Upon completion of page program
- Upon completion of status register write

* If a write operation has not been performed inside the LE25FS406 because, for instance, the command input for any of the write operations (small sector erase, sector erase, chip erase, page program, or status register write) has failed or a write operation has been performed for a protected address, WEN will retain the status established prior to the issue of the command concerned. Furthermore, its state will not be changed by a read operation.

BP0, BP1, BP2, TB (Bits 2, 3, 4, 5)

Block protect BP0, BP1, BP2 and TB are status register bits that can be rewritten, and the memory space to be protected can be set depending on these bits. For the setting conditions, refer to "Table 5 Protect level setting conditions". BP0, BP1, and BP2 are used to select the protected area and TB to allocate the protected area to the higher-order address area or lower-order address area.

Table 5 Protect Level Setting Conditions

Protect Level	Status Register Bits				Protected Area
	TB	BP2	BP1	BP0	
0 (Whole area unprotected)	X	0	0	0	None
T1 (Upper side 1/8 protected)	0	0	0	1	07FFFFh to 070000h
T2 (Upper side 1/4 protected)	0	0	1	0	07FFFFh to 060000h
T3 (Upper side 1/2 protected)	0	0	1	1	07FFFFh to 040000h
B1 (Lower side 1/8 protected)	1	1	0	1	00FFFFh to 000000h
B2 (Lower side 1/4 protected)	1	1	1	0	01FFFFh to 000000h
B3 (Lower side 1/2 protected)	1	1	1	1	03FFFFh to 000000h
4 (Whole area protected)	X	1	X	X	07FFFFh to 000000h

* Chip erase is enabled only when the protect level is 0.

SRWP (bit 7)

Status register write protect SRWP is the bit for protecting the status registers, and its information can be rewritten. When SRWP is "1" and the logic level of the \overline{WP} pin is low, the status register write command is ignored, and status registers BP0, BP1, BP2, TB and SRWP are protected. When the logic level of the \overline{WP} pin is high, the status registers are not protected regardless of the SRWP state. The SRWP setting conditions are shown in "Table 6 SRWP setting conditions".

Table 6 SRWP Setting Conditions

\overline{WP} Pin	SRWP	Status Register Protect State
0	0	Unprotected
	1	Protected
1	0	Unprotected
	1	Unprotected

Bit 6 are reserved bits, and have no significance.

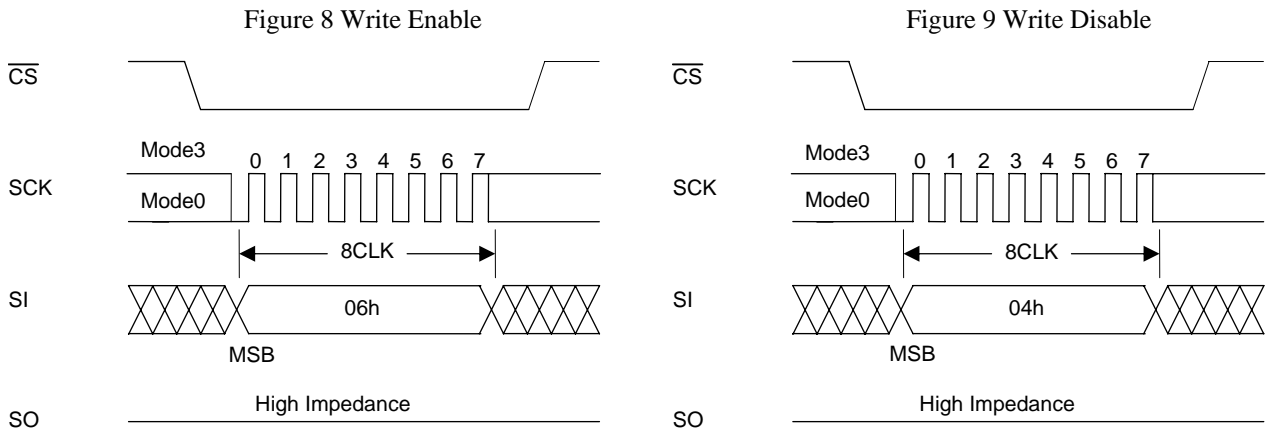

3. Write Enable

Before performing any of the operations listed below, the device must be placed in the write enable state. Operation is the same as for setting status register WEN to "1", and the state is enabled by inputting the write enable command. "Figure 8 Write Enable" shows the timing waveforms when the write enable operation is performed. The write enable command consists only of the first bus cycle, and it is initiated by inputting (06h).

- Small sector erase, sector erase, chip erase
- Page program
- Status register write

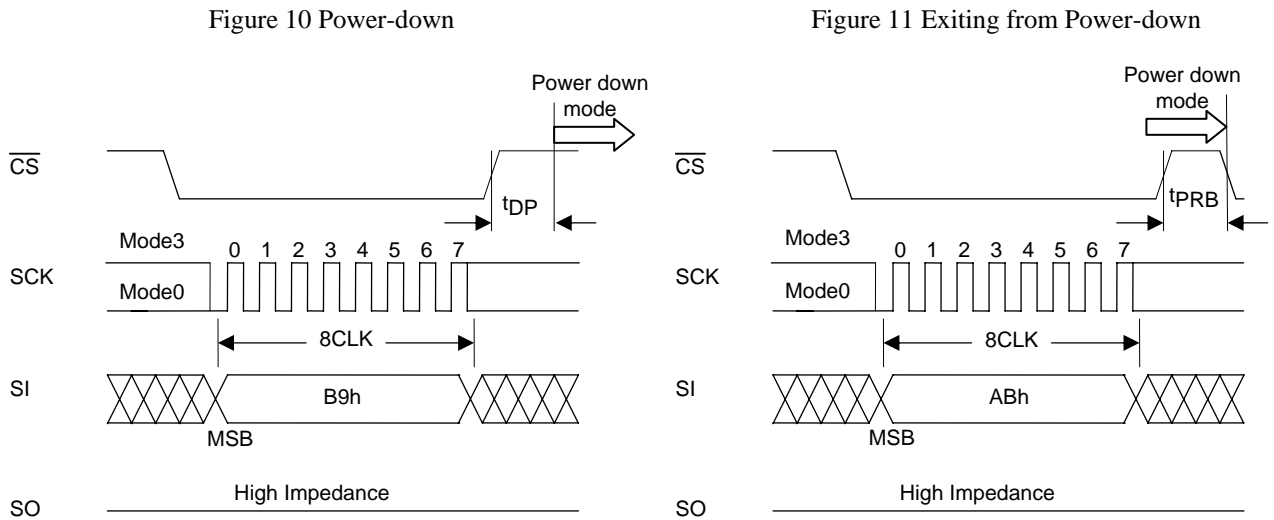

4. Write Disable

The write disable command sets status register WEN to "0" to prohibit unintentional writing. "Figure 9 Write Disable" shows the timing waveforms. The write disable command consists only of the first bus cycle, and it is initiated by inputting (04h). The write disable state (WEN "0") is exited by setting WEN to "1" using the write enable command (06h).

5. Power-down

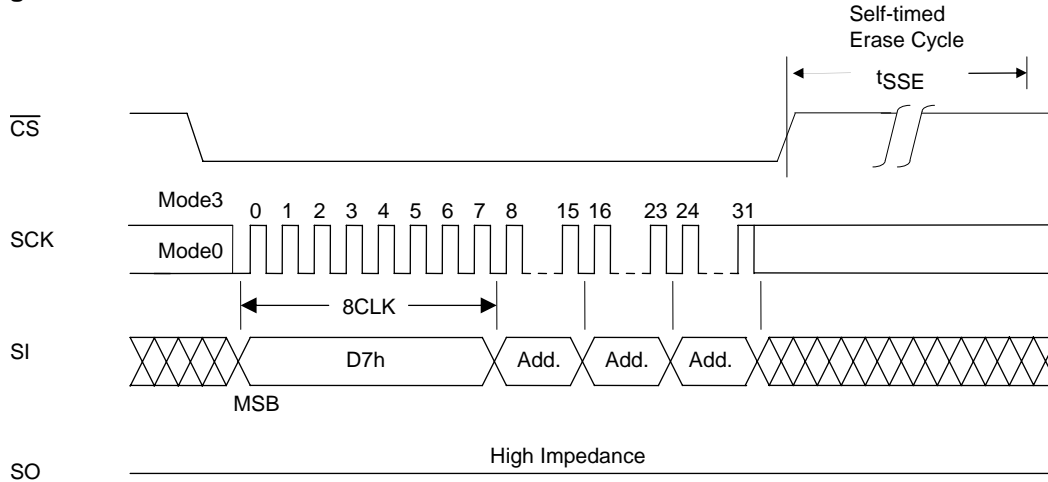

The power-down command sets all the commands, with the exception of the silicon ID read command and the command to exit from power-down, to the acceptance prohibited state (power-down). "Figure 10 Power-down" shows the timing waveforms. The power-down command consists only of the first bus cycle, and it is initiated by inputting (B9h). However, a power-down command issued during an internal write operation will be ignored. The power-down state is exited using the power-down exit command (power-down is exited also when one bus cycle or more of the silicon ID read command (ABh) has been input). "Figure 11 Exiting from Power-down" shows the timing waveforms of the power-down exit command.

6. Small Sector Erase

Small sector erase is an operation that sets the memory cell data in any small sector to "1". A small sector consists of 4Kbytes. "Figure 12 Small Sector Erase" shows the timing waveforms, and Figure 21 shows a small sector erase flowchart. The small sector erase command consists of the first through fourth bus cycles, and it is initiated by inputting the 24-bit addresses following (20h) or (D7h). Addresses A18 to A12 are valid, and Addresses A23 to A19 are "don't care". After the command has been input, the internal erase operation starts from the rising \overline{CS} edge, and it ends automatically by the control exercised by the internal timer. Erase end can also be detected using status register \overline{RDY} .

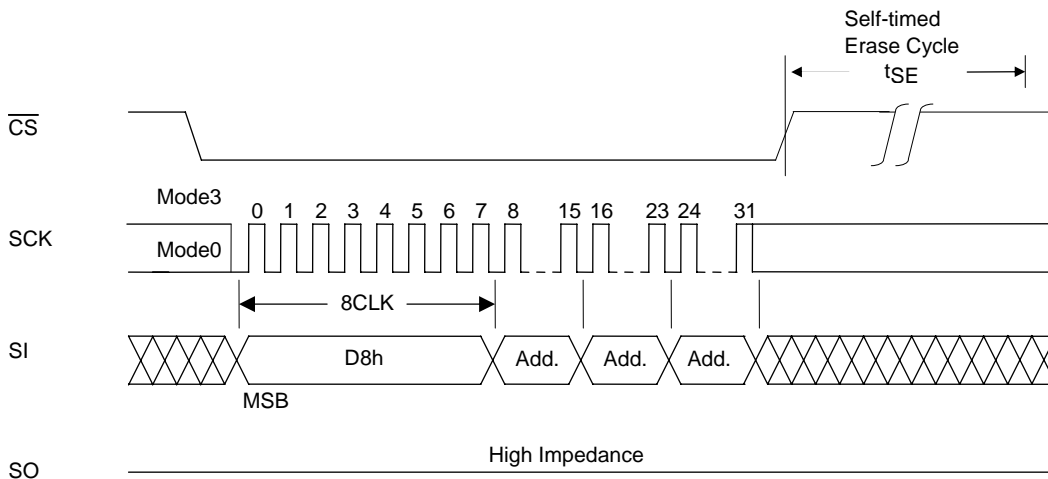

Figure 12 Small Sector Erase

7. Sector Erase

Sector erase is an operation that sets the memory cell data in any sector to "1". A sector consists of 64Kbytes. "Figure 13 Sector Erase" shows the timing waveforms, and Figure 21 shows a sector erase flowchart. The sector erase command consists of the first through fourth bus cycles, and it is initiated by inputting the 24-bit addresses following (D8h). Addresses A18 to A16 are valid, and Addresses A23 to A19 are "don't care". After the command has been input, the internal erase operation starts from the rising \overline{CS} edge, and it ends automatically by the control exercised by the internal timer. Erase end can also be detected using status register \overline{RDY} .

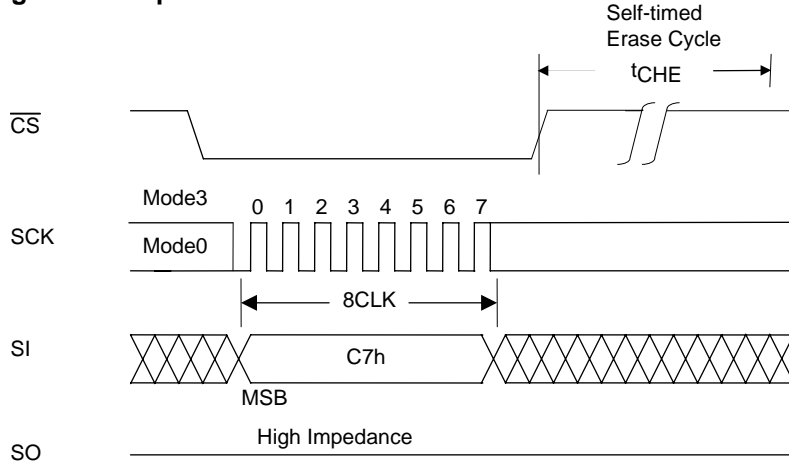

Figure 13 Sector Erase

8. Chip Erase

Chip erase is an operation that sets the memory cell data in all the sectors to "1". "Figure 14 Chip Erase" shows the timing waveforms, and Figure 21 shows a chip erase flowchart. The chip erase command consists only of the first bus cycle, and it is initiated by inputting (60h) or (C7h). After the command has been input, the internal erase operation starts from the rising CS edge, and it ends automatically by the control exercised by the internal timer. Erase end can also be detected using status register RDY.

Figure 14 Chip Erase

9. Page Program

Page program is an operation that programs any number of bytes from 1 to 256 bytes within the same sector page (page addresses: A18 to A8). Before initiating page program, the data on the page concerned must be erased using small sector erase, sector erase, or chip erase. "Figure 15 Page Program" shows the page program timing waveforms, and Figure 22 shows a page program flowchart. After the falling CS edge, the command (02H) is input followed by the 24-bit addresses. Addresses A18 to A0 are valid. The program data is then loaded at each rising clock edge until the rising CS edge, and data loading is continued until the rising CS edge. If the data loaded has exceeded 256 bytes, the 256 bytes loaded last are programmed. The program data must be loaded in 1-byte increments, and the program operation is not performed at the rising CS edge occurring at any other timing.

Figure 15 Page Program

10. Silicon ID Read

ID read is an operation that reads the manufacturer code and device ID information. The silicon ID read command is not accepted during writing. There are two methods of reading the silicon ID, each of which is assigned a device ID. In the first method, the read command sequence consists only of the first bus cycle in which (9Fh) is input. In the subsequent bus cycles, the manufacturer code 62h which is assigned by JEDEC, 2-byte device ID code (memory type, memory capacity), and reserved code are output sequentially. The 4-byte code is output repeatedly as long as clock inputs are present, "Table 7-1 JEDEC ID codes table" lists the silicon ID codes and "Figure 16-a JEDEC ID read" shows the JEDEC ID read timing waveforms.

The second method involves inputting the ID read command. This command consists of the first through fourth bus cycles, and the one byte silicon ID can be read when 24 dummy bits are input after (ABh). "Table 7-2 ID codes table" lists the silicon ID codes and "Figure 16-b ID read" shows the ID read timing waveforms.

If the SCK input persists after a device code is read, that device code continues to be output. The data output is transmitted starting at the falling edge of the clock for bit 0 in the fourth bus cycle and the silicon ID read sequence is finished by setting CS high.

Table 7-1 JEDEC ID read

		Output code
Manufacturer code		62h
2 byte device ID	Memory type	16h
	Memory capacity code	13h(4M Bit)
Device code	1	00h

Table 7-2 ID read

	Output Code
1 byte device ID	3E (LE25FS406)

Figure 16-a Silicon ID Read 1

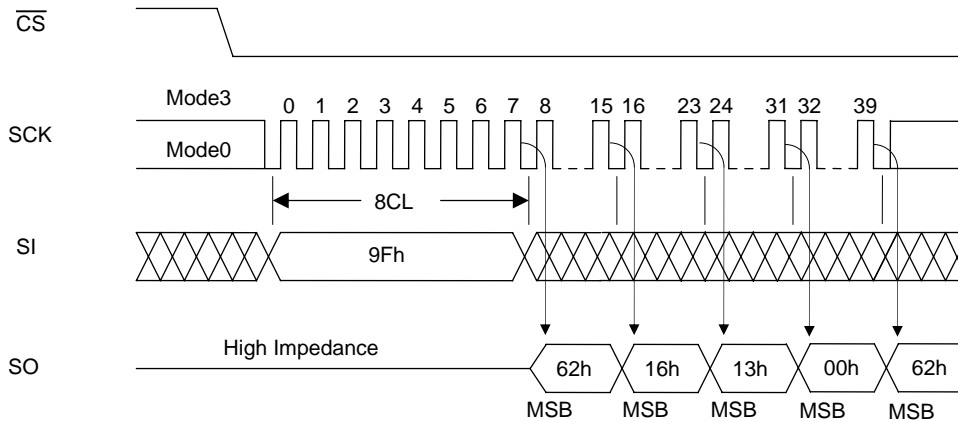

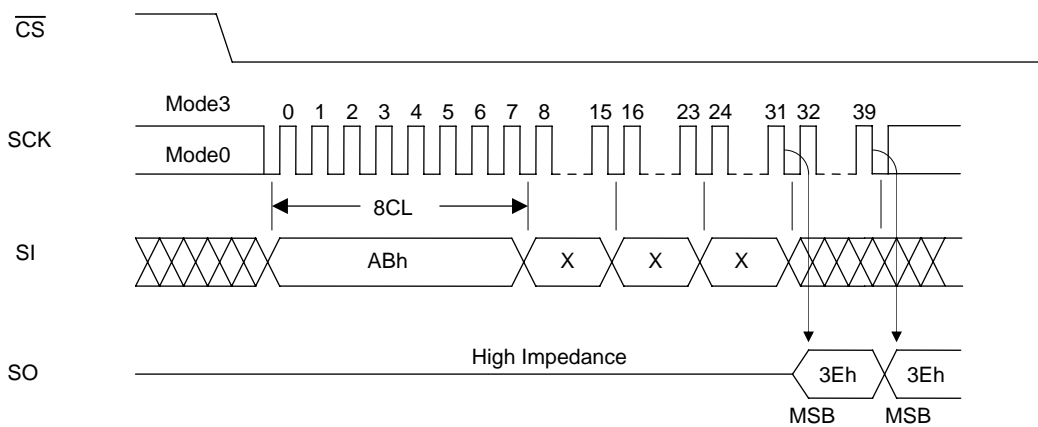

Figure 16-b Silicon ID Read 2

11. Hold Function

Using the $\overline{\text{HOLD}}$ pin, the hold function suspends serial communication (it places it in the hold status). "Figure 17 $\overline{\text{HOLD}}$ " shows the timing waveforms. The device is placed in the hold status at the falling $\overline{\text{HOLD}}$ edge while the logic level of SCK is low, and it exits from the hold status at the rising $\overline{\text{HOLD}}$ edge. When the logic level of SCK is high, $\overline{\text{HOLD}}$ must not rise or fall. The hold function takes effect when the logic level of $\overline{\text{CS}}$ is low, the hold status is exited and serial communication is reset at the rising $\overline{\text{CS}}$ edge. In the hold status, the SO output is in the high-impedance state, and SI and SCK are "don't care".

Figure 17 $\overline{\text{HOLD}}$

12. Power-on

In order to protect against unintentional writing, $\overline{\text{CS}}$ must be within at $V_{\text{DD}}-0.3$ to $V_{\text{DD}}+0.3$ on power-on. After power-on, the supply voltage has stabilized at V_{DD} min. or higher, waits for t_{PU} before inputting the command to start a device operation. The device is in the standby state and not in the power-down state after power is turned on. To put the device into the power-down state, it is necessary to enter a power-down command.

Figure 18 Power-on Timing

13. Hardware Data Protection

LE25FS406 incorporates a power-on reset function. The following conditions must be met in order to ensure that the power reset circuit will operate stably.

No guarantees are given for data in the event of an instantaneous power failure occurring during the writing period.

Figure 19 Power-down Timing

Power-on timing

Parameter	Symbol	spec		unit
		min	max	
power-on to operation time	t _{PU}	100		μs
power-down time	t _{PD}	10		ms
power-down voltage	t _{BOT}		0.2	V

14. Software Data Protection

The LE25FS406 eliminates the possibility of unintentional operations by not recognizing commands under the following conditions.

- When a write command is input and the rising \overline{CS} edge timing is not in a bus cycle (8 CLK units of SCK)
- When the page program data is not in 1-byte increments
- When the status register write command is input for 2 bus cycles or more

15. Decoupling Capacitor

A 0.1μF ceramic capacitor must be provided to each device and connected between VDD and VSS in order to ensure that the device will operate stably.

LE25FS406

Specifications

Absolute Maximum Ratings

Parameter	Symbol	Conditions	Ratings	unit
Maximum supply voltage		With respect to V_{SS}	-0.5 to +2.4	V
DC voltage (all pins)		With respect to V_{SS}	-0.5 to $V_{DD}+0.5$	V
Storage temperature	Tstg		-55 to +150	°C

Operating Conditions

Parameter	Symbol	Conditions	Ratings	unit
Operating supply voltage			1.65 to 2.10	V
Operating ambient temperature		standard device	0 to 70	°C
		Temperature enhancing device (at the planning stage)	-40 to +85	

Allowable DC Operating Conditions

Parameter	Symbol	Conditions	Ratings			unit
			min	typ	max	
Read mode operating current	I _{CCR}	SCK=0.1V _{DD} /0.9V _{DD} , HOLD=WP=0.9V _{DD} , SO=open,25MHz			6	mA
		SCK=0.1V _{DD} /0.9V _{DD} , HOLD=WP=0.9V _{DD} , SO=open,30MHz			8

\overline{CS} setup time		t_{CSS}	10			ns
Data setup time		t_{DS}	5			ns
Data hold time		t_{DH}	5			ns
\overline{CS} hold time		t_{CSH}	10			ns
\overline{CS} wait pulse width		t_{CPH}	25			ns
Output high impedance time from \overline{CS}		t_{CHZ}			15	ns
Output data time from SCK		t_V		10	14	ns
Output data hold time		t_{HO}	1			ns
HOLD setup time		t_{HS}	5			ns
HOLD hold time		t_{HH}	5			ns
Output low impedance time from \overline{HOLD}		t_{HLZ}			12	ns
Output high impedance time from \overline{HOLD}		t_{HHZ}			9	ns
\overline{WP} setup time		t_{WPS}	20			ns
\overline{WP} hold time		t_{WPH}	20			ns
Write status register time		t_{SRW}		8	10	ms
Page programming cycle time	256Byte	t_{PP}		6	8	ms
	nByte			0.15+ N*5.85/356	0.20+ n*7.80/256	ms
Small sector erase cycle time		t_{SSE}		0.04	0.15	s
Sector erase cycle time		t_{SE}		0.08	0.25	s
Chip erase cycle time		t_{CHE}		0.3	3.0	s
Power-down time		t_{DP}			5	μ s
Power-down recovery time		t_{PRB}			5	μ s
Output low impedance time from SCK		t_{CLZ}	0			ns

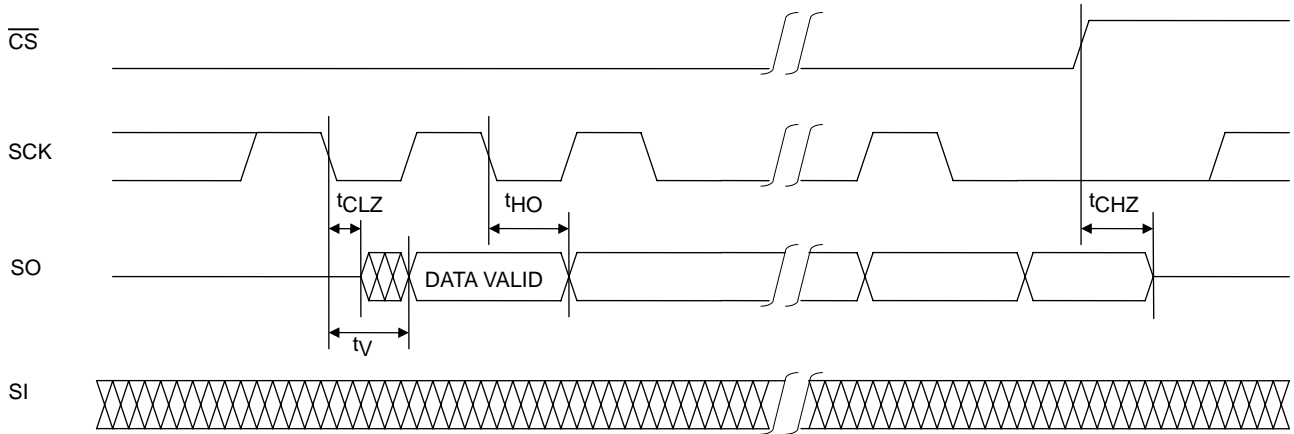

Timing waveforms

Serial Input Timing

LE25FS406

Serial Output Timing

Hold Timing

Status resistor write Timing

AC Test Conditions

- Input pulse level..... $0.2V_{DD}$ to $0.8V_{DD}$
- Input rising/falling time.... 5ns
- Input timing level..... $0.3V_{DD}$, $0.7V_{DD}$
- Output timing level $1/2 \times V_{DD}$
- Output load 15pF

Note: As the test conditions for "typ", the measurements are conducted using 1.8V for V_{DD} at room temperature.

Figure 20 Status Register Write Flowchart

* Automatically placed in write disabled state at the end of the status register write

- SANYO Semiconductor Co.,Ltd. assumes no responsibility for equipment failures that result from using products at values that exceed, even momentarily, rated values (such as maximum ratings, operating condition ranges, or other parameters) listed in products specifications of any and all SANYO Semiconductor Co.,Ltd. products described or contained herein.
- SANYO Semiconductor Co.,Ltd. strives to supply high-quality high-reliability products, however, any and all semiconductor products fail or malfunction with some probability. It is possible that these probabilistic failures or malfunction could give rise to accidents or events that could endanger human lives, trouble that could give rise to smoke or fire, or accidents that could cause damage to other property. When designing equipment, adopt safety measures so that these kinds of accidents or events cannot occur. Such measures include but are not limited to protective circuits and error prevention circuits for safe design, redundant design, and structural design.
- In the event that any or all SANYO Semiconductor Co.,Ltd. products described or contained herein are controlled under any of applicable local export control laws and regulations, such products may require the export license from the authorities concerned in accordance with the above law.
- No part of this publication may be reproduced or transmitted in any form or by any means, electronic or mechanical, including photocopying and recording, or any information storage or retrieval system, or otherwise, without the prior written consent of SANYO Semiconductor Co.,Ltd.
- Any and all information described or contained herein are subject to change without notice due to product/technology improvement, etc. When designing equipment, refer to the "Delivery Specification" for the SANYO Semiconductor Co.,Ltd. product that you intend to use.
- Information (including circuit diagrams and circuit parameters) herein is for example only; it is not guaranteed for volume production.
- Upon using the technical information or products described herein, neither warranty nor license shall be granted with regard to intellectual property rights or any other rights of SANYO Semiconductor Co.,Ltd. or any third party. SANYO Semiconductor Co.,Ltd. shall not be liable for any claim or suits with regard to a third party's intellectual property rights which has resulted from the use of the technical information and products mentioned above.

This catalog provides information as of January, 2011. Specifications and information herein are subject to change without notice.
